

## Introduction

**Indium5.7LT** is an air reflow, halogen-free, no-clean solder paste designed for assembly processes using eutectic SnBi and SnBiAg alloys. This paste is a moderate residue product with exceptional wetting capabilities. The low activation temperature of **Indium5.7LT**, in combination with the SnBi alloy, can be especially useful as a low-temperature, Pb-free solution.

#### **Features**

- Formulated for use with the eutectic 58Bi/42Sn, 57Bi/42Sn/1Ag, and 57.6Bi/42Sn/0.4Ag alloys
- Low-temperature Pb-free solution
- Clear residue
- Exceptional wetting in air reflow
- Halogen-free

#### Alloys

Indium Corporation manufactures low-oxide spherical powder in the industry standard Types 3 and 4 mesh sizes. Other non-standard mesh sizes are available upon request. The weight ratio of the flux/vehicle to the solder powder is referred to as the metal load and is typically in the range of 83–92% for standard alloy compositions.

#### **Standard Product Specifications**

Alloy	Metal Load		Mesh
Alloy	Printing	Dispensing	Size
Indalloy®281 (58Bi/42Sn)			
Indalloy®282 (57Bi/42Sn/1Ag)	90%	84%	Type 3
Indalloy <sup>®</sup> 283 (57.6Bi/42Sn/0.4Ag)			
Indalloy®281 (58Bi/42Sn)	lloy®281 (58Bi/42Sn)		
Indalloy®282 (57Bi/42Sn/1Ag)	89.5%	84%	Type 4
Indalloy®283 (57.6Bi/42Sn/0.4Ag)			

## **Bellcore and J-STD Tests and Results**

Industry Standard Test Results and Classification				
Flux Classification	ROLO	Typical Solder Paste Viscosity for Indalloy®282 T4 (Poise)	2,000	
Based on the testing required by IPC J-Standard-004B		Conforms with all		
Halogen-free per IEC 61249-2-21, Test Method EN14582	<900ppm Cl <900ppm Br <1,500ppm Total	requirements from IPC J-Standard-005A		

All information is for reference only.

Not to be used as incoming product specifications.

## Packaging

Standard packaging for **Indium5.7LT** is 500g jars and 600g cartridges. For dispensing applications, 10 and 30cc syringes are standard. Other packaging options may be available upon request.

#### **Storage and Handling Procedures**

Refrigerated storage will prolong the shelf life of solder paste. Solder paste packaged in syringes and cartridges should be stored tip down.

Packaging	Storage Conditions (unopened containers)	Shelf Life
Syringe	<-10°C	6 months
Jar/Cartridge	<10°C	6 months

Solder paste should be allowed to reach ambient working temperature prior to use. Generally, paste should be removed from refrigeration at least 2 hours before use. Actual time to reach thermal equilibrium will vary with container size. Paste temperature should be verified before use. Jars and cartridges should be labeled with date and time of opening.

## **Technical Support**

Indium Corporation's internationally experienced engineers provide in-depth technical assistance to our customers. Thoroughly knowledgeable in all facets of Material Science as it applies to the electronics and semiconductor sectors, Technical Support Engineers provide expert advice in solder preforms, wire, ribbon, and paste. Indium Corporation's Technical Support Engineers provide rapid response to all technical inquiries.

#### **Safety Data Sheets**

Please refer to the SDS document within the product shipment, or contact our local team to receive a copy.

## Printing

#### **Stencil Design:**

Electroformed and laser cut/electropolished stencils produce the best printing characteristics among stencil types. Stencil aperture design is a crucial step in optimizing the print process. The following are a few general recommendations:

- Discrete components—A 10–20% reduction in stencil aperture area may significantly reduce or eliminate the occurrence of mid-chip solder beads. The "home plate" design is a common method for achieving this reduction.
- Fine-pitch components—A surface area reduction is recommended for apertures of 20mil pitch and finer. This reduction will help minimize solder balling and bridging that can lead to electrical shorts. The amount of reduction necessary is process-dependent (5–15% is common).
- A minimum aspect ratio of 1:5 is suggested for adequate release of solder paste from stencil apertures. The aspect ratio is defined as the width of the aperture divided by the thickness of the stencil.

#### **Recommended Printer Operation**

Solder Paste Bead Size	~20–25mm in diameter
Print Speed	25–150mm/second
Squeegee Pressure	0.018–0.027kg/mm of blade length
Underside Stencil Wipe	Start at once per every 5 prints and decrease frequency until optimum value is reached
Squeegee Type/Angle	Metal with appropriate length; 45 or 60° squeegees are typically used
Separation Speed	5–20mm/second or per equipment manufacturer's specifications
Solder Paste Stencil Life	Up to 8 hours (at 30–60% RH and 22–28°C)

## Cleaning

**Indium5.7LT** is designed for no-clean applications; however, the flux can be removed, if necessary, by using a commercially available flux residue remover.

**Stencil Cleaning**: This is best performed using an automated stencil cleaning system for both stencil and misprint cleaning to prevent extraneous solder balls. Most commercially available stencil cleaning formulations including isopropyl alcohol (IPA) work well.

#### Reflow

**Recommended Profile:** 

This profile is designed for use with Indalloy<sup>®</sup>281 and can serve as a general guideline in establishing a reflow profile for use with other alloys. Adjustments to this profile may be necessary based on specific process requirements.

#### Heating Stage:

A linear ramp rate of 0.5–1°C/second allows gradual evaporation of volatile flux constituents and prevents defects such as solder balling/beading and bridging as a result of hot slump. It also prevents unnecessary depletion of fluxing capacity when using higher temperature alloys.

#### Liquidus Stage:

A peak temperature of  $25-45^{\circ}$ C (175°C shown) above the melting point of the solder alloy is needed to form a quality solder joint and achieve acceptable wetting due to the formation of an intermetallic layer.

#### **Cooling Stage:**

A rapid cool down is desired to form a fine-grain structure. Slow cooling will form a large-grain structure, which typically exhibits poor fatigue resistance. The acceptable cooling range is  $0.5-6.0^{\circ}C/second$  (2.0-6.0°C/second is ideal).

#### **Compatible Products**

• Rework Flux: TACFlux®057

This product data sheet is provided for general information only. It is not intended, and shall not be construed, to warrant or guarantee the performance of the products described which are sold subject exclusively to written warranties and limitations thereon included in product packaging and invoices. All Indium Corporation's products and solutions are designed to be commercially available unless specifically stated otherwise.

All of Indium Corporation's solder paste and preform manufacturing facilities are IATF 16949:2016 certified. Indium Corporation is an ISO 9001:2015 registered company.
