

PRODUCT DATA SHEET

Indium10.1 Pb-Free Solder Paste

Introduction

Indium10.1 is an air or nitrogen reflow, no-clean solder paste specifically formulated to accommodate the higher processing temperatures required by SnAgCu and other Pb-free alloy systems favored by the electronics industry to replace Pb-bearing solders. **Indium10.1** offers exceptional stencil print transfer efficiency to work in the broadest range of processes. In addition, the high oxidation resistance of **Indium10.1** virtually eliminates incomplete coalescence (graping) of small deposits and the head-in-pillow defect. **Indium10.1** also offers extremely low, large ground-plane voiding found in QFN components.

Alloys

Indium Corporation manufactures low-oxide spherical powder composed of a variety of Pb-free alloys that cover a broad range of melting temperatures. This document covers Type 4 and Type 3 powders as standard offerings with SAC alloys. The metal percent is the weight percent of the solder powder in the solder paste and is dependent upon the powder type and application.

Standard Product Specifications

Alloy		Metal Load	
Name	Composition	Type 3	Type 4/4.5
SAC387	95.5Sn/3.8Ag/0.7Cu	88.75%	88.5%
SAC305	96.5Sn/3.0Ag/0.5Cu		
SAC105	98.5Sn/1.0Ag/0.5Cu		
SAC0307	99Sn/0.3Ag/0.7Cu		
SACm®	98.5Sn/0.5Ag/1.0Cu		

Features

- Low voiding on QFN, BGA, and CSP components
- Exceptional head-in-pillow resistance
- High transfer efficiency and low variation through small apertures (≤ 0.66 AR)
- Eliminates the graping phenomenon
- Outstanding RF shield metallization wetting

Storage and Handling Procedures

Refrigerated storage will prolong the shelf life of solder paste. Solder paste packaged in cartridges should be stored tip down.

Storage Conditions (unopened containers)	Shelf Life
Cold Storage ($<10^{\circ}\text{C}$)	12 Months
Room Temperature ($20-30^{\circ}\text{C}$)	30 Days Maximum

Solder paste should be allowed to reach ambient working temperature prior to use. Generally, paste should be removed from refrigeration at least two hours before use. Actual time to reach thermal equilibrium will vary with container size. Paste temperature should be verified before use. Jars and cartridges should be labeled with date and time of opening.

Packaging

Indium10.1 is currently available in 500g jars or 600g cartridges. Packaging for enclosed print head systems is also readily available. Alternate packaging options may be available upon request.

Compatible Products

- Rework Flux: TACFlux®089, TACFlux®020B
- Cored Wire: CW-807
- Wave Flux: WF-7742, WF-9958

Note: Other products may be applicable. Please consult one of Indium Corporation's Technical Support Engineers.

Industry Standard Test Results and Classification

Flux Classification	ROL1	Typical Solder Paste Viscosity for SAC305 T4.5 (Poise)	1450
Based on the testing required by the current revision of IPC J-standard-004.		Conforms with all requirements from the current revision of IPC J-standard-005.	

All information is for reference only. Not to be used as incoming product specifications.

Indium10.1 Pb-Free Solder Paste

Printing

Stencil Design:

Electroformed and laser cut/electropolished stencils produce the best printing characteristics among stencil types. Stencil aperture design is a crucial step in optimizing the print process. The following are a few general recommendations:

- Discrete components — A 10–20% reduction of stencil aperture has significantly reduced or eliminated the occurrence of mid-chip solder beads. The “home plate” design is a common method for achieving this reduction.
- Fine pitch components — A surface area reduction is recommended for apertures of 20 mil pitch and finer. This reduction will help minimize solder balling and bridging that can lead to electrical shorts. The amount of reduction necessary is process dependent (5–15% is common).
- For optimum transfer efficiency and release of the solder paste from the stencil apertures, industry standard aperture and aspect ratios should be adhered to.

Printer Operation	
Solder Paste Bead Size	~20-25mm in diameter
Print Speed	50-100mm/second
Squeegee Pressure	0.018-0.027Kg/mm of blade length
Underside Stencil Wipe	Start at once per every 5 prints and decrease frequency until optimum value is reached
Squeegee Type/Angle	Metal with appropriate length / ~60 degrees
Separation Speed	5-20mm/second or per equipment manufacturer's specifications
Solder Paste Stencil Life	18 hrs. (at 30-60% RH and 22-28°C)

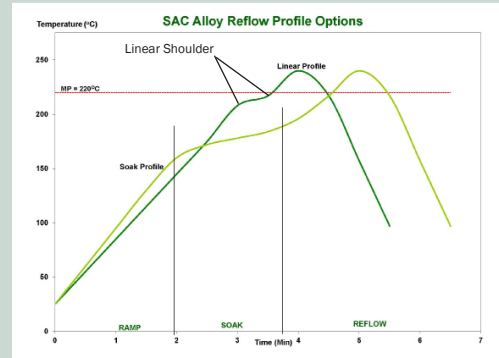

Cleaning

Indium10.1 is designed for no-clean applications. However, the flux can be removed if necessary by using a commercially available flux residue remover.

Stencil Cleaning is best performed using isopropyl alcohol (IPA) as a solvent. Most commercially available non-water-based stencil cleaners work well.

Reflow

Recommended Profile:

The stated profile recommendations apply to most Pb-free alloys in the SnAgCu (SAC) alloy system, including SAC305 (96.5Sn/3.0Ag/0.5Cu). This can be used as a general guideline in establishing a reflow profile when using **Indium10.1** solder paste. Deviations from these recommendations are acceptable, and may be necessary, based on specific process requirements, including board size, thickness, and density. Start with the linear profile, then move to the optional soak profile if needed. The flat soak portion of the linear profile (linear shoulder) may also be eliminated.

Note: All parameters are for reference only. Modifications may be required to fit process and design.

Reflow Profile Details	SAC305 Parameters		Comments
	Recommended	Acceptable	
Ramp Profile (Average Ambient to Peak) - Not the Same as Maximum Rising Slope	0.5–1°C/Second	0.5–2.5°C/Second	To minimize solder balling, beading, hot slump
Soak Zone Profile (Optional)	30–90 Seconds	30–120 Seconds	May minimize BGA/CSP voiding Eliminating/reducing the soak zone may help to reduce HIP and graping
	160–180°C	150–200°C	
Time Above Liquidus (TAL)	45–60 Seconds	30–100 Seconds	Needed for good wetting/reliable solder joint As measured with thermocouple
Peak Temperature	230–260°C	230–262°C	
Cooling Ramp Rate	2–6°C/Second	0.5–6°C/Second	Rapid cooling promotes fine grain structure
Reflow Atmosphere	Air or N ₂		N ₂ preferred for small components
