Ball Attach Flux NC-506

Features
- Suitable for Pin-Grid Array and standard Ball Grid Array applications
- Airless Packaging
- Excellent solderability to all common surface metallizations
- No-clean residue
- Can be used for printing, dipping, and pin transfer deposition
- Offers high yields in BGA bumping process
- Suitable for both Pb-Free or Sn/Pb applications

Introduction
Ball Attach Flux NC-506 is a low viscosity thixotropic no-clean flux designed for use in ball attachment to substrates (BGA manufacturing). It is especially useful in applications requiring soldering to surface finishes with tenacious oxides, such as nickel. It can also be used wherever a no-clean ball attach flux is needed, and is suitable for a variety of different deposition methods.

Cleaning
NC-506 is designed for no-clean applications. If necessary, the flux can be removed by using a commercially available flux cleaner. Please contact an Indium Corporation Technical Service Engineer for recommendations of cleaners to suit your process needs.

Packaging
NC-506 is available in 30cc syringes. Other packaging can be provided to meet specific requirements.

Application
Pin transfer volumes can be optimized by changing equipment parameters. Key variables of pin transfer include pin shape, pin diameter, shear speed, dwell and depth of immersion.
**Storage**

NC-506 syringes and cartridges should be stored tip down at 0°C to ≤30°C for maximum shelf life. After removing from cold storage, NC-506 should be allowed to stand for a minimum of 4 hours at room temperature before using.

**Technical Support**

Indium Corporation sets the industry standard in providing rapid response, on-site technical support for our customers worldwide. Indium’s team of Technical Support Engineers can provide expertise in all aspects of Materials Science and Semiconductor Packaging process applications.

**Material Safety Data Sheets**

The MSDS for this product can be found online at http://www.indium.com/techlibrary/msds.php

---

**Reflow**

**Recommended Profile:**

Peak reflow temperature should be <260°C in an air or nitrogen atmosphere (<500ppm O₂), with a linear ramp up to 30°C above liquidus temperature. These profiles are recommended to the user as starting points, and should be optimized by the user to meet their individual process needs.
