

APPLICATION NOTE

Calculating Solder Paste Usage

Calculating the Volume of Solder Paste

Many people try to determine the volume of solder paste that they will use on a given circuit board or during a full production run. Calculating the exact amount of solder paste needed can be difficult to achieve because of the print deposit variations, the paste left on the stencil and squeegees after the build is complete, and the bead size needed for the build, which will depend on the squeegee size. The theoretical volume of solder paste can be calculated for each board using the Greely Formula and a simple volume calculation.

The Greely Formula allows for the calculation of the specific gravity of the particular solder paste being used.

The Greely Formula:

$$\frac{\text{Alloy Specific Gravity} \times \text{Flux Specific Gravity}}{(\text{Flux \%} \times \text{Alloy Specific Gravity}) + (\text{Metal \%} \times \text{Flux Specific Gravity})}$$

Specific gravity of the flux vehicle is generalized to 1.

Example:

- Solder paste: SAC305, Indium8.9HFA, Type 4.5, 87.75%
- Aperture size: 0.012" square
- Stencil thickness: 0.004"

$$\frac{7.4\text{g/cm}^3 \times 1}{(12.25\% \times 7.4\text{g/cm}^3) + (87.75\% \times 1)}$$

Solder paste specific gravity = 4.14

Volume for this aperture can be calculated using this formula: Length x Width x Height

$$0.012" \times 0.012" \times 0.004" = 0.000000576 \text{ inches}^3$$

To get the theoretical weight of the solder paste for the 0.012" square aperture, multiply the solder paste theoretical volume by the solder paste density. Convert the volume units from inches³ to cm³ by multiplying the volume in inches³ by 16.3871.

$$0.000000576 \text{ inches}^3 \times 16.3871 = 0.000009439 \text{ cm}^3 \times 4.14 \text{g/cm}^3 = 0.0000391 \text{ gm}$$

To calculate the theoretical amount of solder paste that will be used for each board, the weight of solder paste for each aperture on the board needs to be calculated. Once all of the weights have been calculated, they can be added together, which will result in the amount of solder paste per board.

This is the theoretical value and not an actual value. The easiest way to determine the actual paste weight per board is to weigh a board before the paste has been printed and then again after the paste has been printed. The difference is the actual solder paste weight, or consumption of solder paste per board. Some error will occur using this calculation depending on the weight tolerances of the board and the variations in solder paste deposits from print to print.

This product data sheet is provided for general information only. It is not intended, and shall not be construed, to warrant or guarantee the performance of the products described which are sold subject exclusively to written warranties and limitations thereon included in product packaging and invoices. All Indium Corporation's products and solutions are designed to be commercially available unless specifically stated otherwise.

All of Indium Corporation's solder paste and preform manufacturing facilities are IATF 16949:2016 certified. Indium Corporation is an ISO 9001:2015 registered company.
