**Introduction**

Wafer Flux WS-3401-A is a high viscosity semiconductor-grade flux, specifically optimized as a damming flux for the edge of the wafer and to prevent backside contamination. Working with the natural surface tension of solder, WS-3401-A produces uniform hemispherical bumps without solder-robbing or solder-bridging.

**Features**

- Water-soluble
- Viscosity suitable for 150–300mm wafers as a damming flux
- No residue after multiple reflow/cleaning cycles
- Uniform bump shape
- Halogen-free—no intentionally added (NIA) halogens
- Suitable for SnPb and Pb-free, and high temperature applications
- Non-corrosive to underbump metallization

All information is for reference only. Not to be used as incoming product specifications.

**Application**

WS-3401-A can be applied by standard spin coating techniques, but may be too viscous for many applications.

For copper-pillar applications, WS-3401-A is used (in conjunction with WS-3401) as a damming flux around the edge of the wafer to prevent backside contamination.

**Cleaning**

WS-3401-A is designed to be cleaned with DI water or water with an added cleaner. Ideal conditions for spray cleaning are 25°C or higher for >1 minute at >60psi.

**Packaging**

Wafer Flux WS-3401-A is sold by weight (grams) and is available in appropriate containers from 100g to 3.5kg (3,500 grams = approximately 1 gallon). Other packaging can be provided to meet specific requirements.

**Storage**

WS-3401-A containers should be stored at ≤25°C for maximum shelf life. Storage temperatures should not exceed 25°C for more than 4 days, and should never exceed 30°C. After removing from cold storage, WS-3401-A should be allowed to stand for at least 4 hours at room temperature before using.

Reflow
Recommended Profile:

The above profile is recommended as a starting point for 300mm wafers with SnAg solder microbumps, and should be optimized by the user to meet their individual process needs. Wafers should be reflowed in a nitrogen atmosphere (<10ppm O₂ is recommended, but <20ppm O₂ may be feasible; however, results may not be optimal). Note that bridging or solder thieving may be seen for fine-pitch microbumps (<60 microns) on copper-pillars, and that reducing the peak temperature will reduce the occurrence of this failure mode.
